

JurisMind: RAG-Based Legal Case Assistant

JurisMind is a Retrieval-Augmented Generation (RAG) based Legal Case Assistant designed to support legal professionals, law students, and researchers in conducting efficient legal research. The system enables users to upload legal documents such as court judgments, acts, regulations, and legal articles into a centralized knowledge base.

Unlike traditional AI chatbots that rely solely on pre-trained knowledge, JurisMind retrieves relevant legal information from uploaded documents before generating a response. By combining semantic search with Large Language Models (LLMs), the system provides accurate, context-aware, and source-grounded legal assistance.

The platform uses document embeddings and vector search techniques to identify the most relevant legal content related to a user's query. The retrieved information is then passed to the language model, which generates responses based on the retrieved legal evidence, ensuring reliability and transparency.

Problem Statement

Legal professionals often spend significant time reviewing large volumes of legal documents to identify relevant judgments, statutory provisions, and precedents. Traditional keyword-based search systems may return numerous irrelevant results, making legal research time-consuming and inefficient.

Furthermore, legal documents are lengthy and complex, requiring substantial effort to extract meaningful insights. There is a need for an intelligent legal research system that can retrieve relevant legal information from a large document repository and generate concise, context-aware answers supported by legal evidence.

Proposed Solution

JurisMind transforms traditional legal document repositories into an intelligent RAG-powered legal research system. By combining semantic retrieval with language generation, the platform provides accurate, source-supported legal insights, enabling users to identify relevant laws, precedents, and legal references efficiently. The system significantly reduces research time while improving the accessibility and effectiveness of legal analysis and case preparation.
