

CareerQuest:Your Placement Preparation Assistant

CareerQuest is an AI-powered placement preparation assistant that helps students efficiently access company-specific interview experiences, aptitude materials, coding questions, resume guidelines, and recruitment insights. The system utilizes Retrieval-Augmented Generation (RAG) to retrieve relevant information from a centralized knowledge base and generate accurate, context-aware responses to user queries.

Problem Statement

Students preparing for campus placements often depend on a variety of resources such as interview experiences, aptitude preparation materials, coding question banks, company profiles, and resume-building guides. These resources are typically scattered across multiple platforms and documents, making it difficult and time-consuming to find relevant information when needed.

Traditional search methods require students to manually browse through numerous files and sources, which can lead to inefficient preparation and missed opportunities to learn from previous candidates' experiences. Additionally, placement requirements and interview patterns vary significantly across companies, creating a need for personalized and company-specific guidance.

To address these challenges, there is a need for an intelligent platform that can organize placement-related resources and provide instant, accurate, and context-aware answers to students' questions. Such a system should enable students to retrieve relevant information quickly, helping them prepare more effectively for aptitude tests, technical interviews, coding assessments, and HR rounds.

Proposed Solution

CareerQuest leverages Retrieval-Augmented Generation (RAG) to create a smart placement preparation platform. The system allows users to upload and manage placement-related resources, including interview experiences, aptitude notes, coding questions, company recruitment patterns, and preparation guides.

When a student asks a question, the system retrieves the most relevant information from its knowledge base using semantic search techniques. The retrieved content is then provided to a Large Language Model (LLM), which generates a concise and accurate response based on the retrieved evidence.

By combining information retrieval with generative AI, CareerQuest delivers reliable and explainable answers while reducing the time students spend searching through large volumes of placement materials.
