

Task 27 – AgenticAI Problem Statement

Problem Description:

In many educational institutions, attendance tracking is still done manually using Excel sheets or spreadsheets. Faculty members often struggle with:

- Identifying students with low attendance quickly
- Sending individual warning emails manually
- Maintaining proper records of notifications
- Generating summary reports for compliance and review

This manual process is time-consuming, repetitive, and error-prone, especially when handling large class sizes. It also delays timely communication with students who are at risk of falling below required attendance percentages.

Proposed Solution:

An Automated Attendance Alert System using n8n is designed to streamline the entire process.

Workflow Overview

- Faculty uploads attendance file (Json)
- System reads and extracts student data
- Attendance percentage is evaluated
- If attendance < 80%:
 - Personalized warning email is generated
 - Email is sent automatically
 - Notification is logged in Google Sheets or database
- A final summary report is generated for faculty
